1839. A simple antibody adsorption test. Quantitative relation-
ships of influenza virus-antibody union. Gy. Takatsy, J. Furecz, MD
and E. Farkas *Acta physiol. Acad. Sci. hung.* 1954, 6, 241-254. A
simple, inexpensive and rapid antibody adsorption test is described,
based on the use of the following techniques: Takatsy's method of
virus prep., (*Acta med. hung.* III, 1952, 2, 185), Takatsy's loop
for the dilution of the adsorbed serum in the hamagglutination-
inhibition test [HI]; sedimentation of the virus-antibody complex
after specific agglutination by centrifugation. Six strains of virus
from England, Sweden, Paris, Budapest, and Denmark were used.
The adsorption potency of virus (the amount of virus required for
the adsorption of one antibody unit) is variable. It depends on
the ratio "amount of virus/amount of antibody". If the ratio is
constant the actual amounts of virus and antibody do not affect
the reaction at all. A given quantity of virus adsorbs a considerably
smaller amount of HI antibody from a serum which was partially
adsorbed than from a serum the HI titre of which was brought to a
similar value by dilution. A given no. of HI units combines with
more virus in the latter serum than in the former one. The
difference is not due to a disturbing action exerted by the virus-
antibody complex remaining in the mixture after adsorption.

1913. TAKÁTSY, G. State Inst. of publ. Hlth, Budapest.* The use of spiral loops in serological and virological micro-methods.
ACTA MICROBIOL. ACAD. SCIENT. HUNG. (Budapest) 1955, 3/1-2 (191-202)
 illus. 12

The new micro-method presented makes use of grooved, translucent, plastic trays and calibrated spiral wire loops instead of tubes and pipettes. Each plate bears 6 X 12 grooves of 0.15 ml. capacity. The loops made of heat resistant elastic wire are prepared in different forms, so as to be capable of holding 0.025 to 0.20 ml. of fluid respectively. Dilutions for different serological purposes or viral haemagglutination are made in 0.025 ml. of a diluent (dripped in the grooves by means of a special instillator) by serially transferring the loops from groove to groove. For mixing the reagents the loops are rotated while in the groove. Using the plates, loops and instillator, haemagglutination, haemagglutination inhibition and complement fixation reactions are to be carried out very quickly, with extremely small amounts of reagents. At the same time this method avoids all the drawbacks of pipetting, thus rendering the results more clear-cut and accurate. The appearance and use of the equipment are described in detail and illustrated by several photos.

441. TAKÁTSY Gy. and HAMAR M State Inst. of Hyg., Budapest. •The antibody content of immune sera absorbed with influenza virus, as determined by different serological tests ACTA MICROBIOL. ACAD. SCIENT. HUNG. 1956. 3/3 (299-306) Graphs 1 Tables 3

Comparative studies on the heterologous and homologous antibody content of untreated and absorbed influenza immune sera are presented, as revealed by the neutralization, haemagglutination inhibition, complement fixation and complement fixation inhibition tests. As an explanation of the results obtained a hypothesis concerning the nature of the influenza antibodies is suggested.

"Vaccination Against Influenza in Hungary, 1961-1962"

Budapest, Acta Microbiologica Academiae Scientiarum Hungaricae, Vol 9, No 4, 1962/63; pp 361-390.

Abstract [Article in English; authors' English summary]: The effectiveness of immunization with a subcutaneous influenza A-2 vaccine was estimated by the observation of 13,321 vaccinees and 24,455 control subjects. In the course of an influenza A-2 epidemic 3-4 months after the vaccinations 36.9% of the controls and 16.9% of the vaccinees contracted the disease. In the vaccinated group the average period of nursing was 40% shorter than in the control patients. Some features of the 1962 influenza epidemic which affected 23% of Hungary's population, are described. [Two Hungarian references].

TITLE: Serological evidence of the incidence of influenza equine A-1 virus infections
among horses in Hungary

SOURCE: Academia scientiarum hungaricae. Acta microbiologica, v. 12, no. 3, 1965,
289-294

TOPIC TAGS: animal, antibody, animal disease, virus, serum, disease incidence,
virus disease

ABSTRACT: Horses in 12 stocks were screened for hemagglutination-inhibiting
antibodies to the subtypes equine A-1 and A-2, human A-2 and swine A-1 of the influenza
virus. A total of 835 sera were tested, 487 of which were taken from race horses.
Antibodies were found only to the subtype equine A-1 virus. The incidence of these
antibodies was high in horses over 3 years of age, in each of the stocks tested.
Colts 2-3 years old were tested in 4 stocks. Of these, an average of 49 per cent
were found to have equine A-1 antibodies in two closely related stocks. In the
other two stocks, the colts were practically seronegative. It is concluded that
equine A-1 virus has been highly disseminated in Hungary before 1961 and that it
persists in certain horse stocks. Orig. art. has: 1 figure and 2 tables. [Orig.

Academiya nauk SSSR, Institut fiziki Zemli

Voprosy inzhenernoy seismologii, vyp. 3 (Problems in Engineering Seismology, No. 3) Moscow, 1965, 191 p. 1,700 copies printed. (Series: Izv. Vuzov, no. 10 (177))

Resp. Eds.: S.V. Medvedev, Doctor of Technical Science, and A.Z. Kata, Candidate of Physics and Mathematics; Ed. of Publishing House: L.K. Vishnogradskaya, Tech. Ed.: P.S. Kashina.

PURPOSE: This book is intended for seismologists, and engineers concerned with the construction of earthquake-resistant buildings.

CONTENTS: This is a collection of 15 articles by different authors on problems of engineering seismology. Individual articles discuss the effects of surface on various structures; seismic activity in the Sochi-Krasnodar, Krasnodar-Polyana, and Pokrovsk-Ural'skiy regions; and ground vibrations during strong earthquakes. One article discusses the effect of the acceleration of 500 tons of weight area on buildings located 1000 m away. No formalities are mentioned. Each article is accompanied by references.

"Bashkiriya," (Bashkirskaya ASSR), published by State Publishing House for Literature on Geography, Moscow, 1950.

The author defines this book as a geographic and economical survey of the Bashkirskaya ASSR and, accordingly, many pages of this book are dedicated to geographic descriptions with a few information on the geology of this "republic" and to its various industries, among which agriculture plays a prominent part.

Title : On Roentgenodiagnosis of Carcinoma of the Jaws.

Orig. Pub : Vrachehn. delo, 1957, No 8, 837-840

Abstract : In 137 patients with carcinoma of the jaws, the author attempted to define more accurately the roentgenologic picture of this disease. Usually, carcinoma of the jaws appears as a result of carcinoma migration from surrounding regions (lip, affected lymph node, cavity of mouth, mucosa of cheek, as well as nasal cavity and cavern of maxilla). The roentgenologic picture of this lesion is multiform. Usually, a lesser or greater degree of bone destruction is discovered. For carcinoma, a fast change of the roentgenologic picture is characteristic, which manifests itself in resorption of bone tissue without reaction

AUTHORS: Avdeyev, A. V., Takher, Ye. A.

TITLE: On the problem of removing the binder from semifinished ceramics obtained by casting from thermoplastic slip

PERIODICAL: Referativnyy zhurnal. Khimiya, no. 4, 1963, 429 -430, abstract 4M27 (Tr. Gos. issled. elektrokem. in-ta, no. 4, 1960, 86 - 92)

TEXT: In semifinished goods with a height < 150 mm and a wall thickness < 10 mm, the maximum ratio of height to diameter being 2:1, the binder can be removed by using paraffin with a 10 % admixture of oils as a binding agent in the casting of electrical ceramic slips, without using any mineral additive. The specimens have to be placed on bases with a high absorptivity. The thermal treatment of the semifinished specimen must guarantee a maximum removal of the binder by exudation; the best results in this respect were obtained by the addition of 10 % spindle oil to the paraffin. The addition of mineral oils to paraffin reduces the temperature of exudation of the product by about 4°C . As the addition of spindle oil to the paraffin may cause some thickening of the slip, only specimens with Card 1/2
